
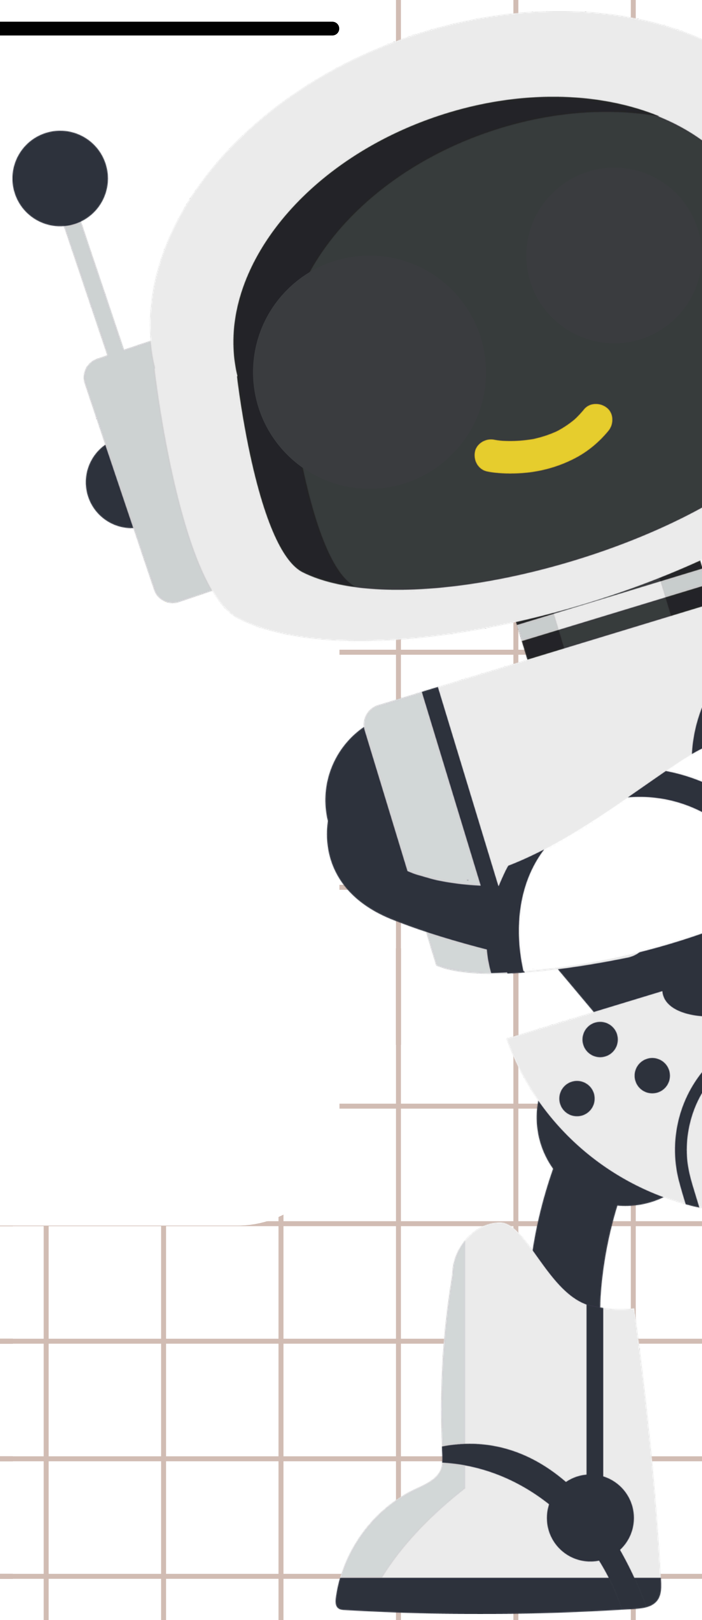
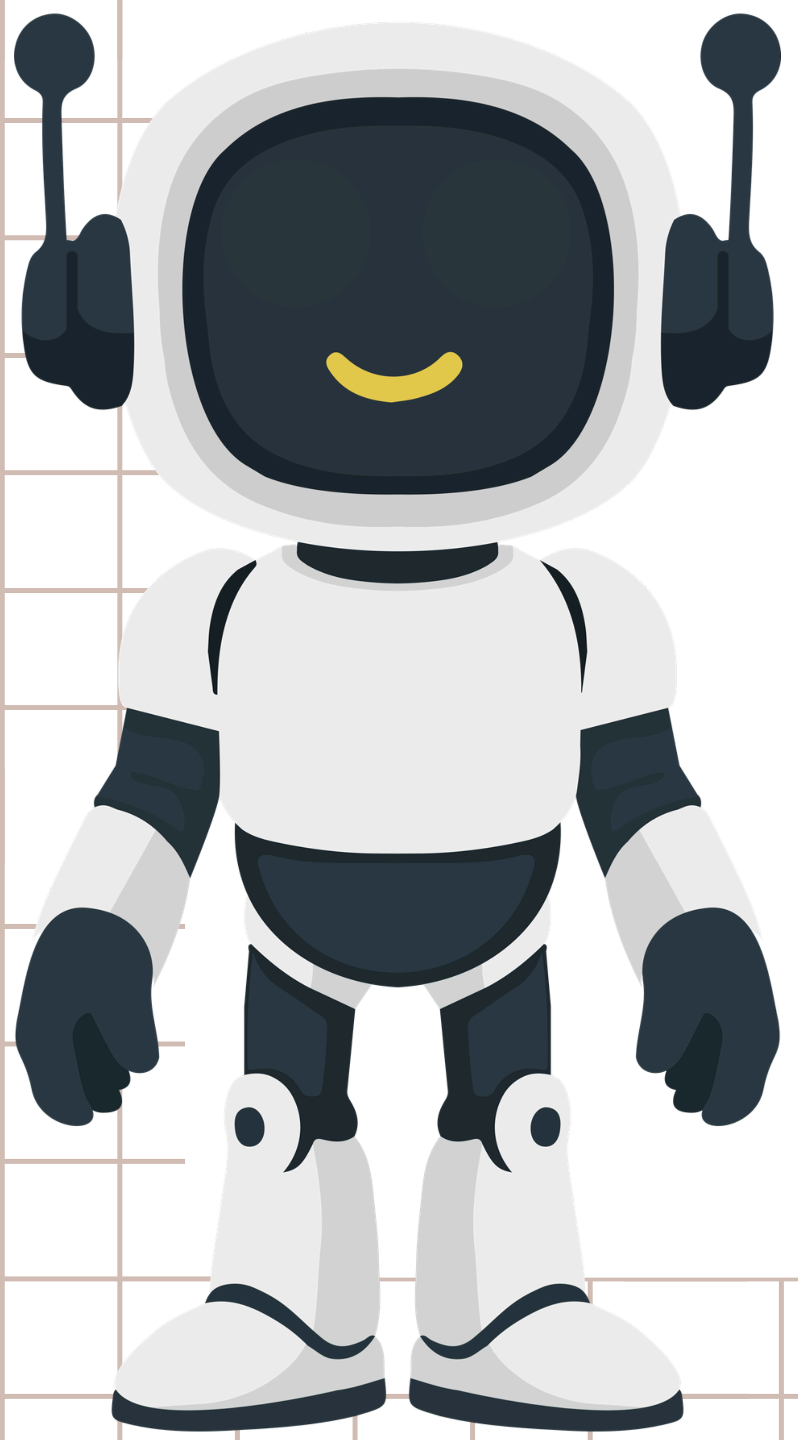
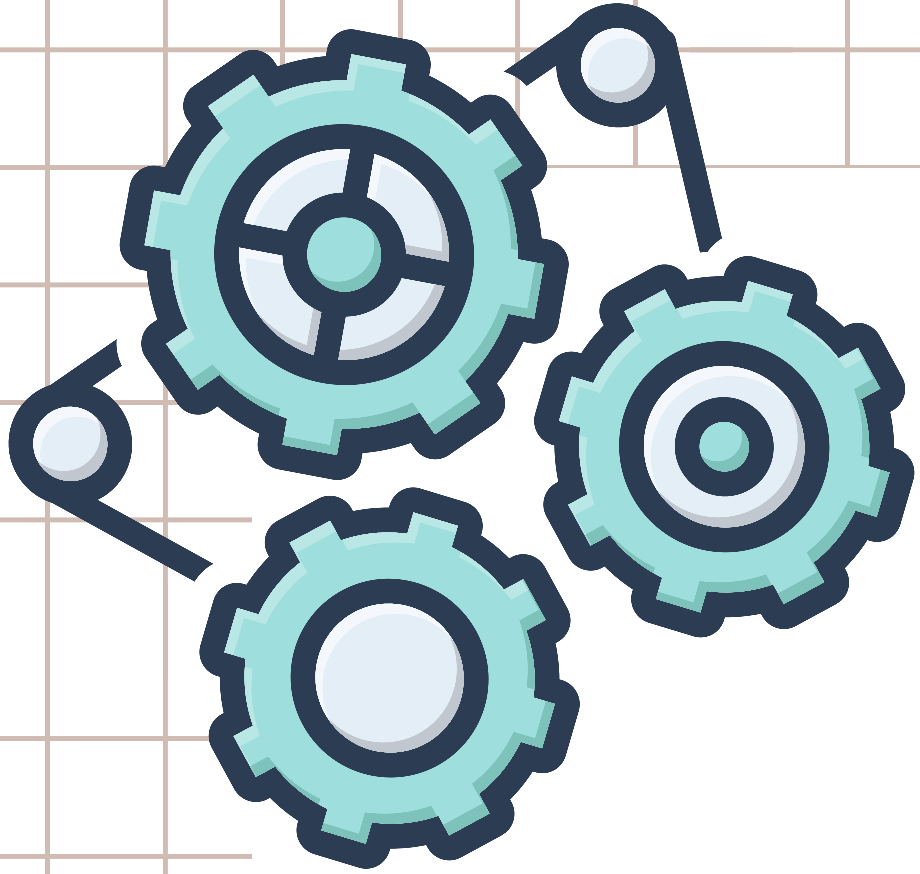
ANTI-THEFT ALARM





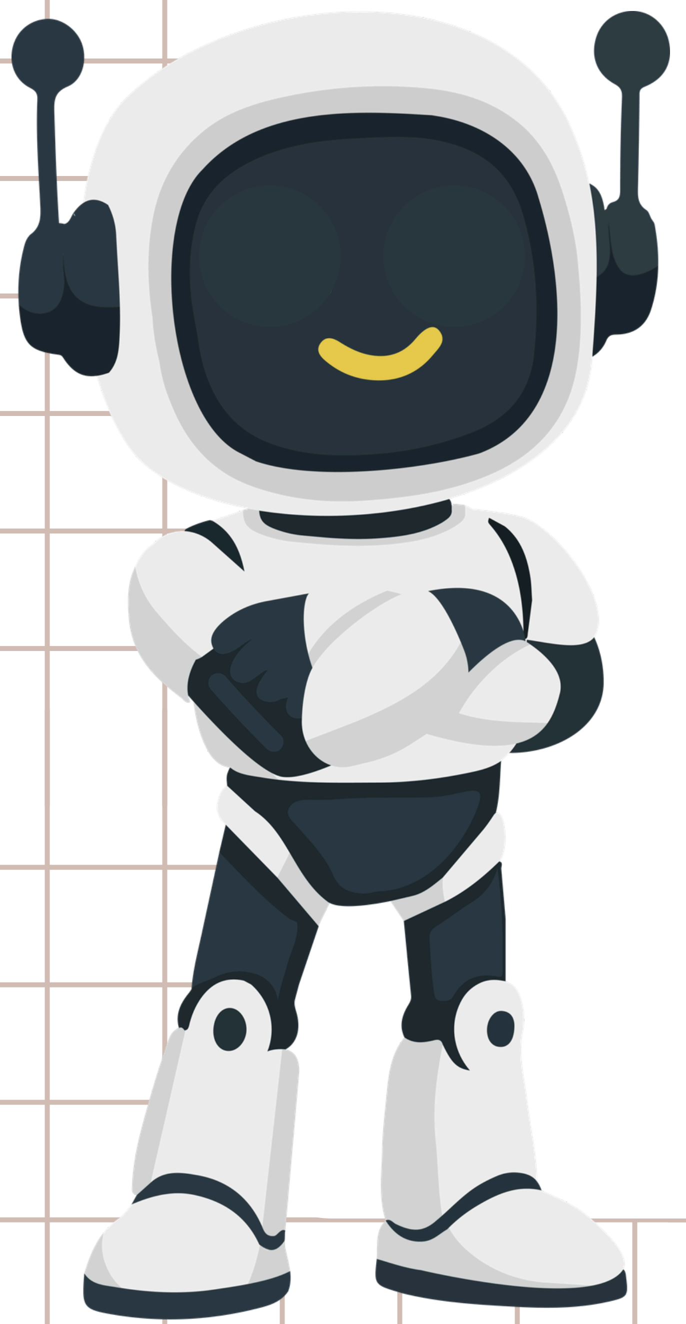
INTRODUCTION

- Traditional lockers mainly depend on keys or basic locks.
- Keys can be lost, copied, or misused, increasing security risks.
- Smart Secure Locker detects unauthorized movement using a PIR sensor.
- PIN-based access adds an extra layer of security.
- Buzzer, LED, and 📱 mobile alerts provide quick notifications.
- The system is simple, compact, affordable, and easy to use.



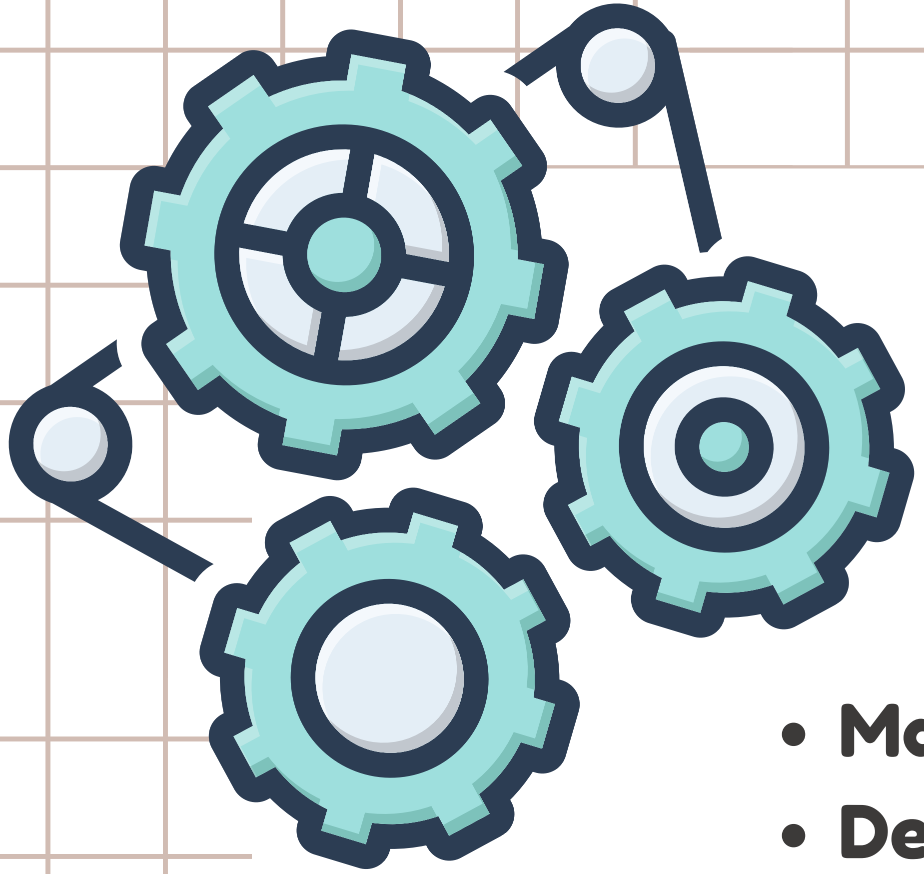
INNOVATION & UNIQUENESS

- Smart movement detection
- Instant mobile notification
- Dual alert: Buzzer + Mobile
- Low-cost & easy to build
- Works with existing lockers
- Real-time security monitoring
- Scalable for multiple lockers



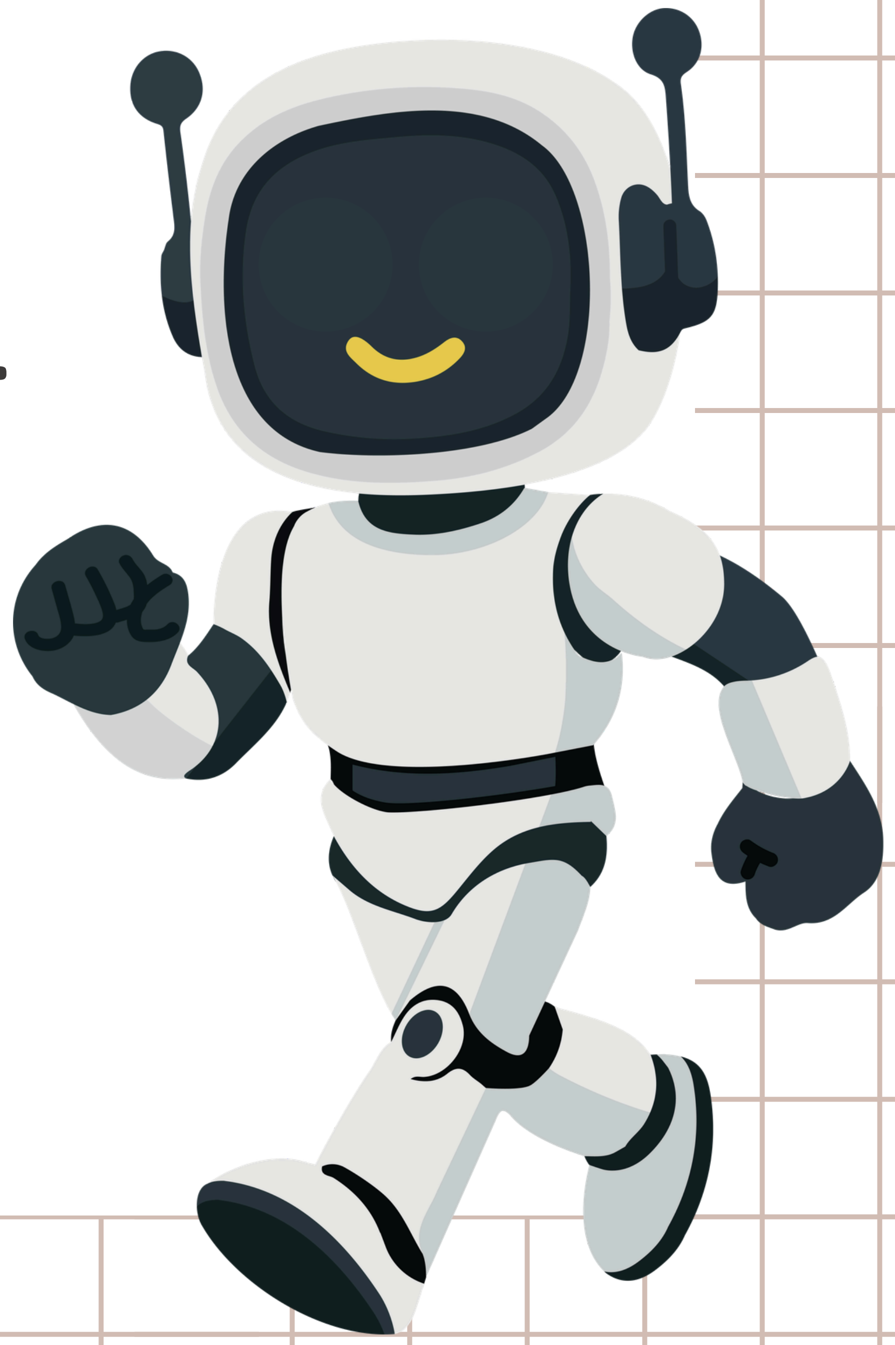
PROBLEMS FACED BY USERS

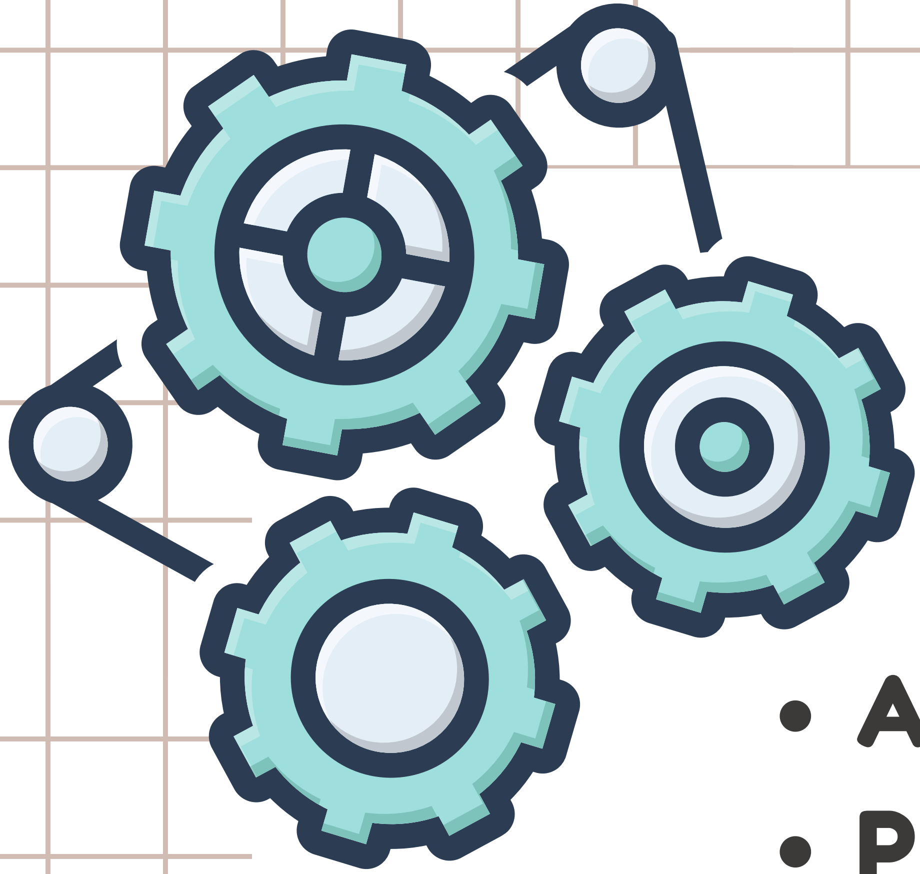
- Traditional locks can be lost, damaged, or easily misused.
- Users may not know when someone is trying to access their locker.
- There is usually no instant notification when suspicious activity occurs.
- Basic lockers do not provide an automatic alarm.
- They offer limited security with only one layer of protection.
- Users cannot monitor their locker remotely.



GOALS

- Make lockers more secure against unauthorized access.
- Detect unusual movement around the locker.
- Allow access only through a correct PIN.
- Quickly alert the user when something suspicious happens.
- Send mobile notifications for important security events.
- Build a solution that is simple, affordable, and practical.

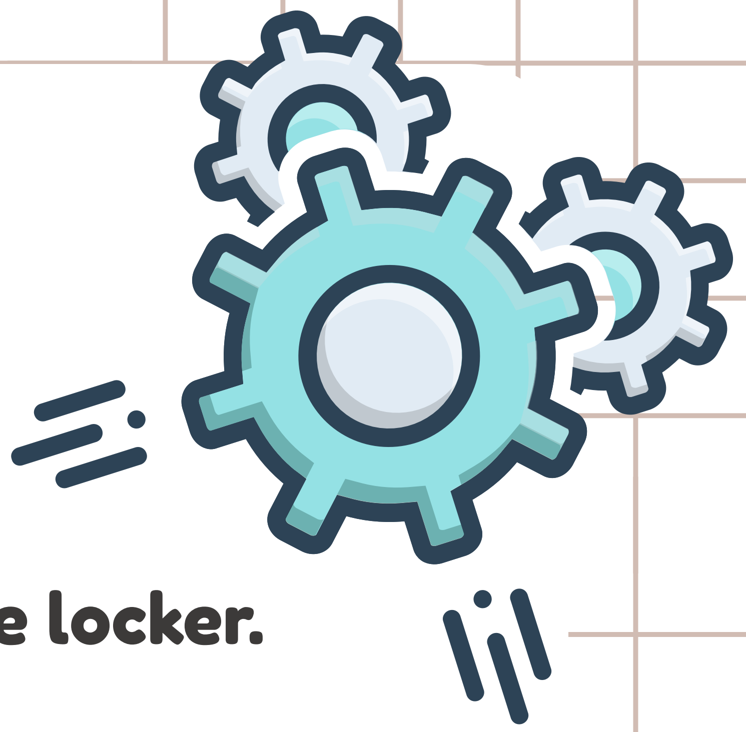




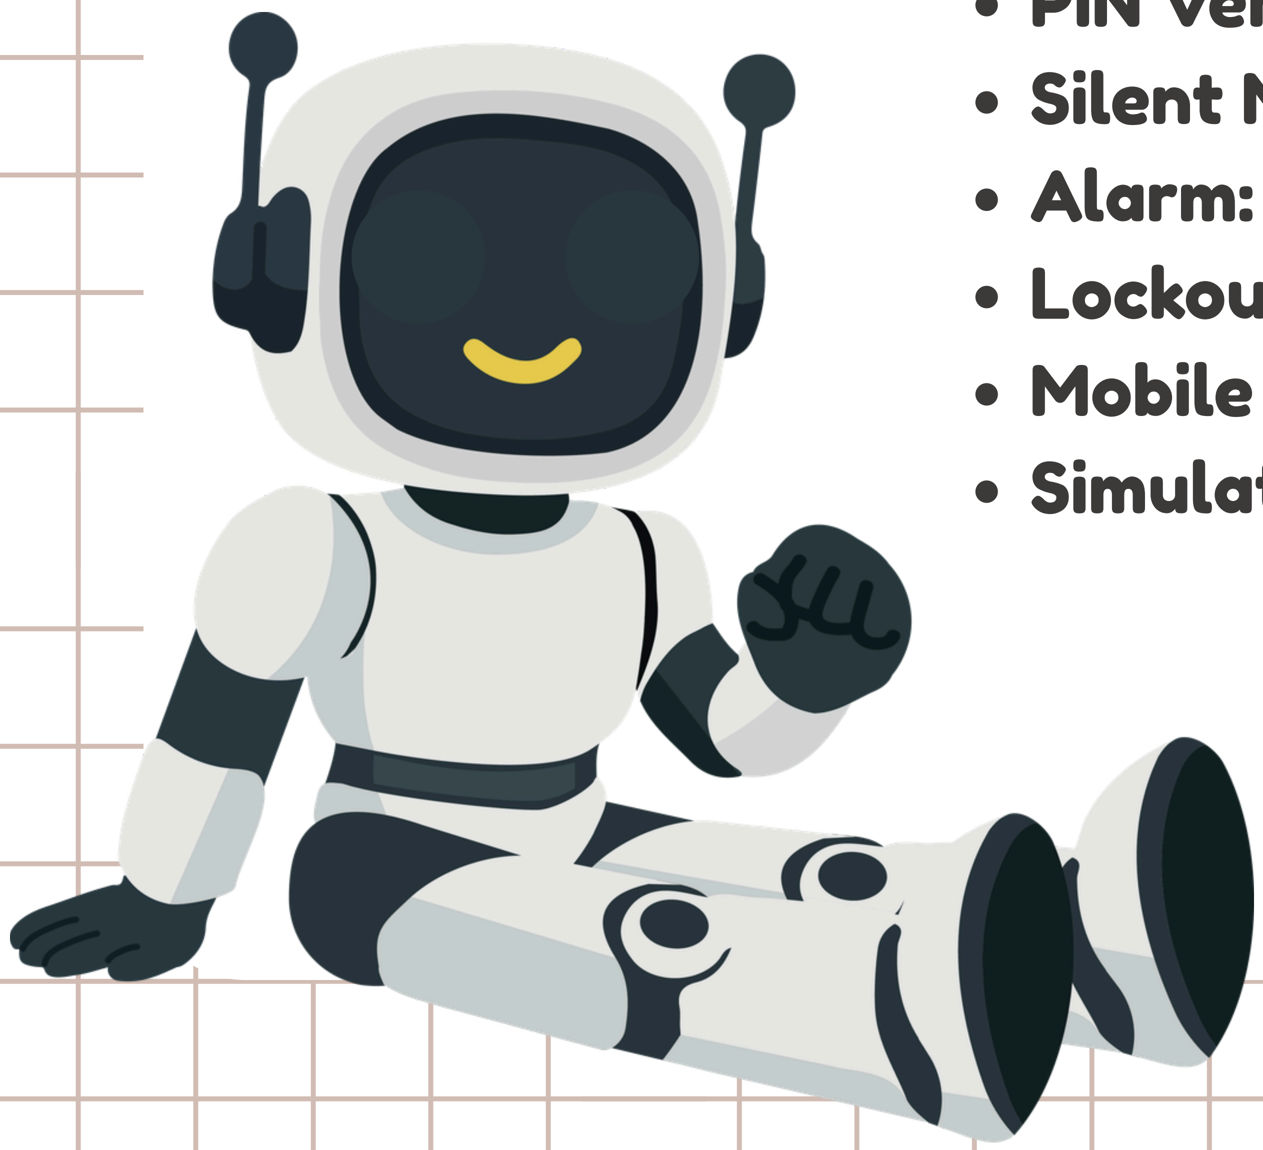
TECHNOLOGIES TO BE USED

- Arduino – Main controller
- PIR Sensor – Detects movement
- Keypad – User authentication
- Buzzer & LED – Instant local alert
- IoT / Wi-Fi – Sends mobile notifications
- Mobile App – Remote alerts and monitoring
- Tinkercad – Circuit simulation & testing

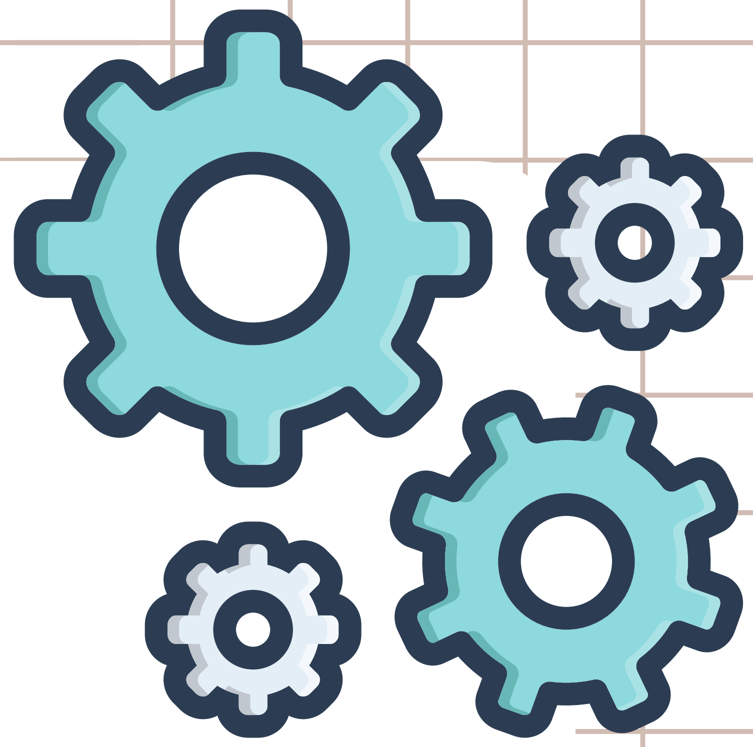
METHODOLOGY

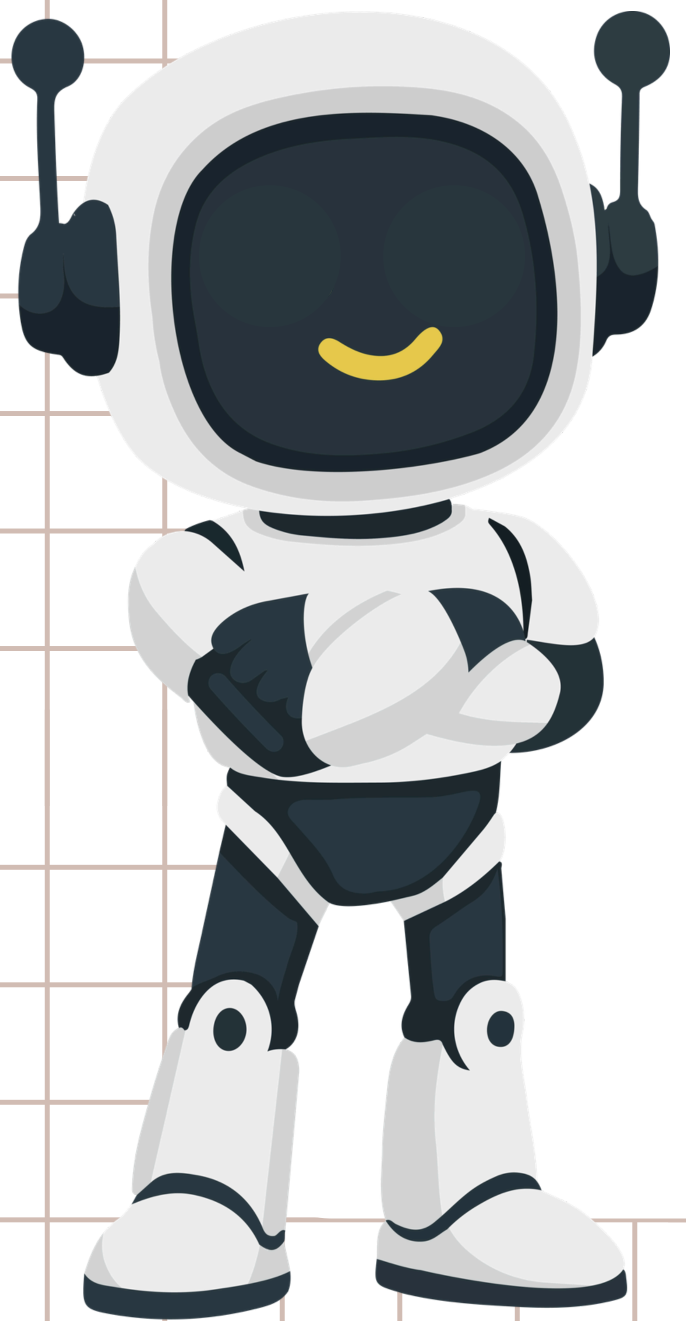


- **Motion Detection:** PIR sensor detects movement near the locker.
- **Warning:** A 3-second warning is provided for PIN entry.
- **PIN Verification:** User enters the PIN using the 4x4 keypad.
- **Silent Mode:** Correct PIN activates silent mode for 10 seconds.
- **Alarm:** Wrong PIN triggers the buzzer and LED.
- **Lockout:** Multiple wrong attempts activate lockout mode.
- **Mobile Alert:** Suspicious activity sends a notification to the user's phone.
- **Simulation:** The complete system is designed and tested in Tinkercad.



RESULT





- Enhanced Locker Security through motion detection and PIN authentication.
- Quick Threat Detection with buzzer and LED alerts.
- Instant User Awareness through mobile notifications.
- Unauthorized Access Protection using wrong-attempt lockout.
- Fast & Reliable Response with an automated security process.
- Low-Cost Solution that can be easily implemented in real lockers.
